Plot	No
Options	Predefined date available, Precision of date to year, date, hour or minute

Description

A Date element represents a time stamp that can be edited by clicking on the time bringing up a calendar.

Details

Date elements are used to attach a time stamp to your SMARTree data. The time can be locked and log conditions include equal to, before or after the specified date. This allows the user, for example, to define a deadline or expiration date that would flag the tree or subtree. When specifying an ‘equal to’ condition the user can define the range in time that meets that requirement.

For example, on the same day, hour or minute as the element time.

- **Logic Conditions**
- The Time is before a predefined date
- Today’s Date
- The Time is matches a predefined date
- The Time is after a predefined date
