

SMARTree 2.5 introduced GIT integration allowing users to take advantage of the powerful features available with one of the most used version control platforms in the world. With embedding GIT you have:

- Protected data with backups of all committed SMARTree repositories
- Access to the current working state of your SMARTrees within both local and remote work environments
- Ability to work with teams using GIT and all the benefits this platform has to offer
- Revert or recall prior SMARTree states from previous commits

Those familiar with GIT will quickly come up to speed on how it works within SMARTree. The video on this page highlights the process in detail
